1 Suffix Trees
Suffix Trie

We saw the suffix trie, but we also saw its size grows *quadratically* with the length of the string
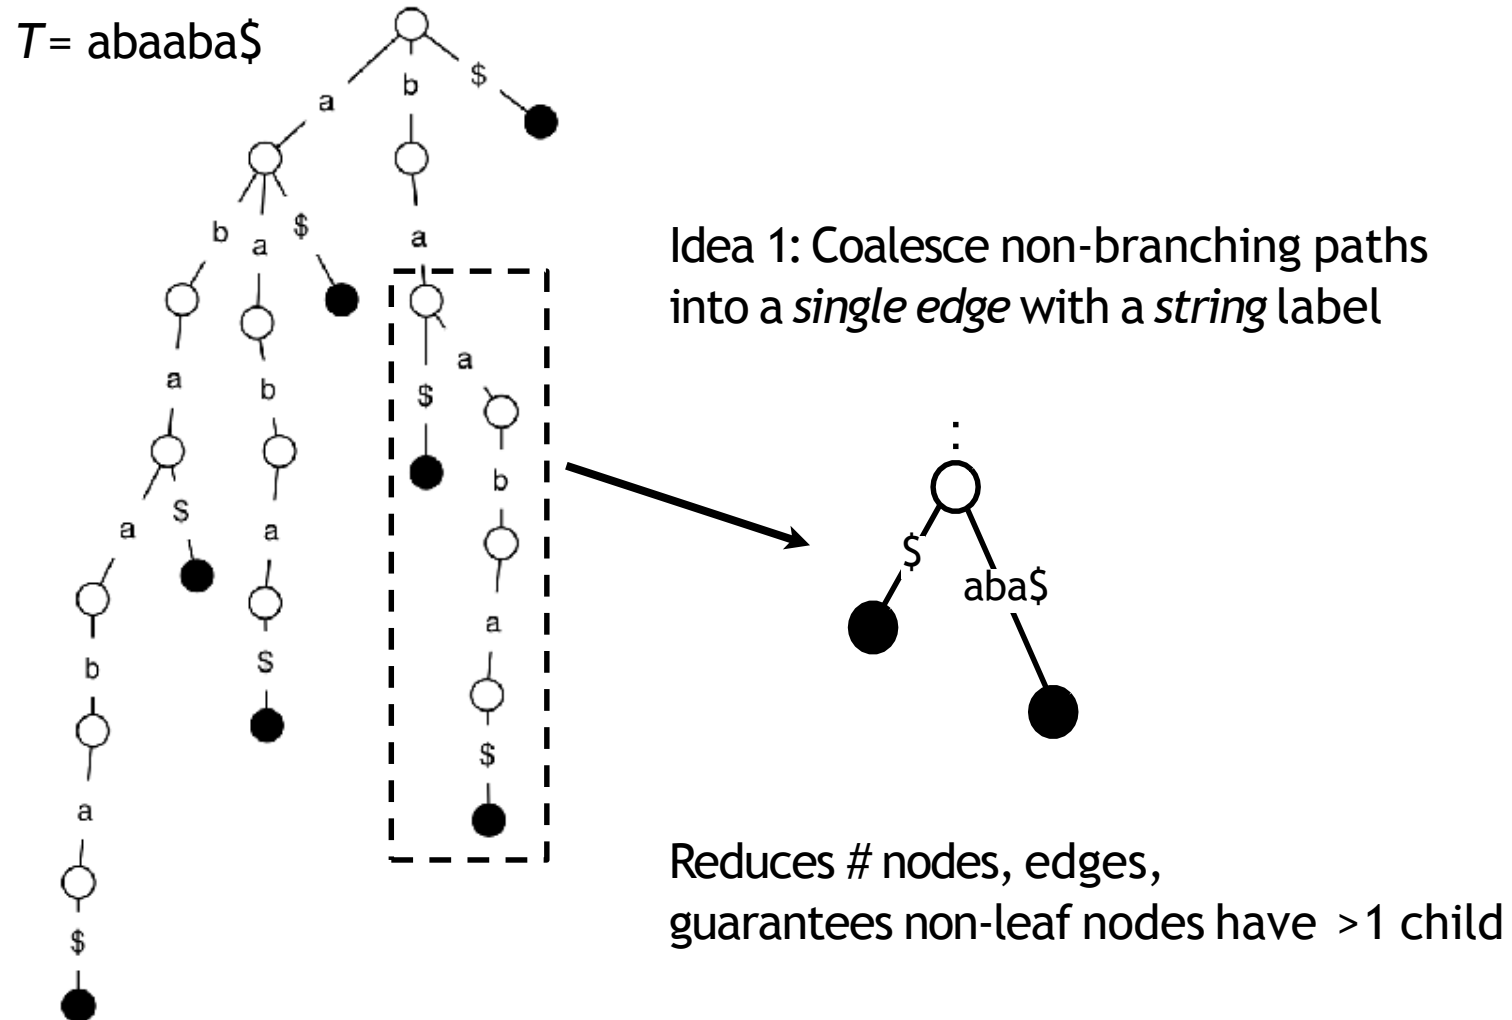

Human genome is $3 \cdot 10^9$ bases long.

If $m = 3 \cdot 10^9$, m^2 is way huge, far beyond what we can store in memory

Suffix trie: making it smaller

T = abaaba$

# Suffix trie: making it smaller

T = abaaba$

Idea 1: Coalesce non-branching paths into a *single edge* with a *string* label

Reduces # nodes, edges, guarantees non-leaf nodes have >1 child

Suffix trie: making it smaller
T = abaaba$

Suffix tree

T = abaaba$ $|T|$ = m

leaves? m
non-leaf nodes (bound)?   ≤m-1

≤ 2m -1 nodes total — $O(m)$

Is *total size O(m)* now?

No: total length of edge labels grows with m^2

Suffix tree

Idea 2: Store *T* itself in addition to the tree. Convert tree's edge labels to (offset, length) pairs with respect to *T*
T = abaaba$

Suffix tree

Idea 2: Store *T* itself in addition to the tree. Convert tree's edge labels to (offset, length) pairs with respect to *T*.

*T* = abaaba$

Space is now $O(m)$ Suffix trie was $O(m^2)$!

Suffix tree: building

Method 1: build suffix trie, coalesce non- branching paths, relabel edges
$O(m^2)$ time, $O(m^2)$ space

Method 2: build single-edge tree representing longest suffix, augment to include the 2nd-longest, augment to include 3rd-longest, etc (Gusfield 5.4)

$O(m^2)$ time, $O(m)$ space

Suffix tree: building

Canonical method: Ukkonen's algorithm

$O(m)$ time and space!

Won't cover it in class; see Gusfield Ch. 6 for details

Algorithmica

On-Line Construction of Suffix Trees[1]

E. Ukkonen[2]

Abstract. An on-line algorithm is presented for constructing the suffix tree for a given string in time linear in the length of the string. The new algorithm has the desirable property of processing the string symbol by symbol from left to right. It always has the suffix tree for the scanned part of the string ready. The method is developed as a linear-time version of a very simple algorithm for (quadratic size) suffix *tries*. Regardless of its quadratic worst case this latter algorithm can be a good practical method when the string is not too long. Another variation of this method is shown to give, in a natural way, the well-known algorithms for constructing suffix automata (DAWGs).

Key Words. Linear-time algorithm, Suffix tree, Suffix trie, Suffix automaton, DAWG.
Canonical algorithm for $O(m)$ time & space suffix tree construction

$

aba$

$

aba$

ba

aba$

$

aba$

S = baa
Yes, it's a
substring

Suffix tree

How do we check whether a string *S* is a
suffix of *T*?

Same procedure as for suffix trie, but
we have to deal with coalesced edges

S = aba
Yes, it's a suffix

Suffix tree

How do we check whether a string *S* is a suffix of *T*?

Same procedure as for suffix trie, but we have to deal with coalesced edges

S = abaaba
Yes, it's a suffix

How do we check whether a string *S* is a suffix of *T*?

Same procedure as for suffix trie, but we have to deal with coalesced edges

a
ba
$

ba
$

ba
$

S = ab
No, not a suffix

$
aba$

aba$
Suffix tree

How do we count the **number of times** a string *S* occurs as a substring of *T*?

Same procedure as for suffix trie

S = aba
Occurs twice
Suffix tree

We can also **count or find** all the matches of *P* to *T*. Let *k* = # matches.

E.g., *P* = ab, *T* = abaaba$

O(n)

Step 1: walk down ab path

    If we "fall off" there are no matches

O(k)

Step 2: visit all leaf nodes below

    Report each leaf offset as match offset

\# leaves in subtree is is k,

\# non-leaves is ≤ k-1

O(n + k) time overall

abaaba
ab ab
Suffix tree: some bounds

	Suffix tree
Time: Does P occur?	$O(n)$
Time: Count k occurrences of P	$O(n + k)$
Time: Report k locations of P	$O(n + k)$
Space	$O(m)$

$m = |T|, n = |P|, k = \#$ occurrences of P in T

2 Longest Common Substring
Suffix Tree Application: Find Longest Common Substring
Dots are *maximal unique matches* (*MUMs*), a kind of long substring shared by two sequences

Red = match between like strands
green = different strands

Axes are strains of Helicobacter pylori, bacterium found in stomach & associated with ulcers

Suffix Tree Application: Find Longest Common Substring

Find longest common substring (LCS) of *X* and *Y*, make a new string **X#Y$** where #, $ are both terminal symbols. Build a suffix tree for **X#Y$**.

X = xabxa   *Y* = babxba
X#*Y*$ = xabxa#babxba$
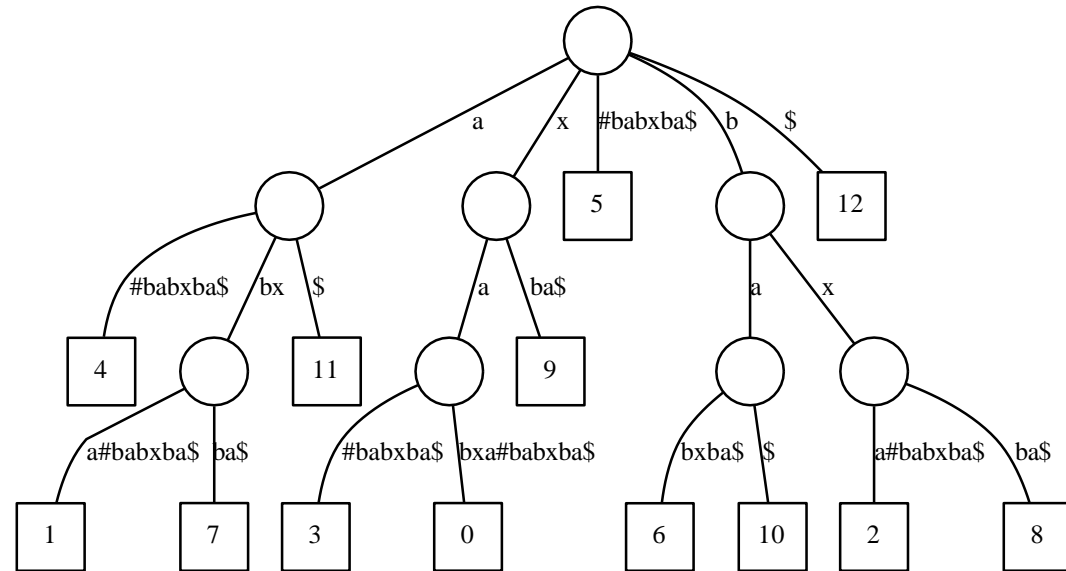

For clarity, if a suffix includes part of both strings, let's hide the portion after the #

Suffix Tree Application: Find Longest Common Substring

Find longest common substring (LCS) of *X* and *Y*, make a new string **X#Y$**
where #, $ are both terminal symbols. Build a suffix tree for **X#Y$**.

X = xabxa   *Y* = babxba
X#*Y*$ = xabxa#babxba$
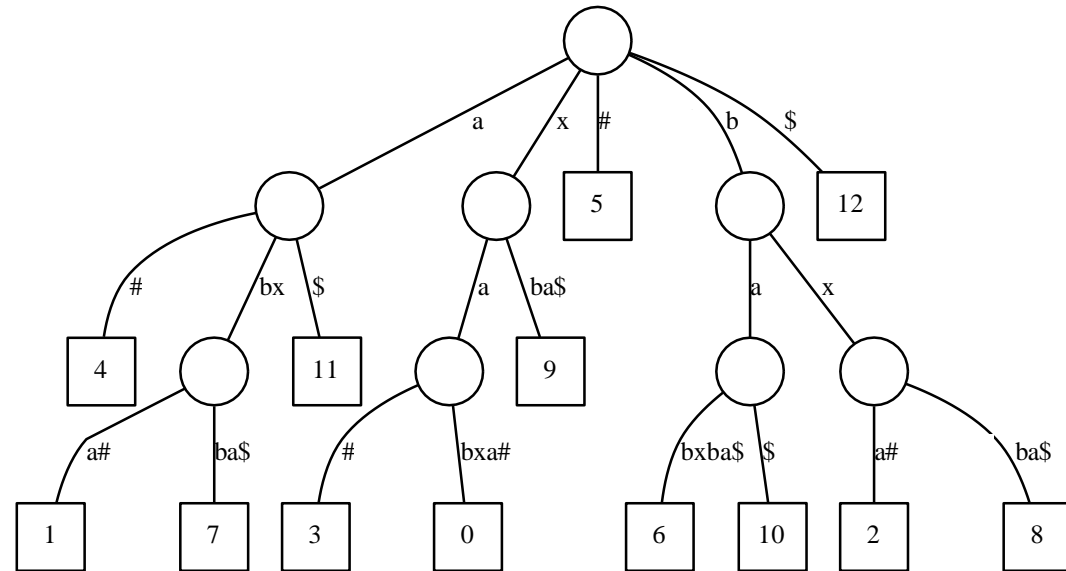

For clarity, if a suffix includes part of both strings,
let's hide the portion after the #

Now suffixes of **X** end in # and suffixes of **Y** end in $

Suffix Tree Application: Find Longest Common Substring

Find longest common substring (LCS) of *X* and *Y*, make a new string ***X#Y$***
where #, $ are both terminal symbols. Build a suffix tree for ***X#Y$***.

X = xabxa   ***Y*** = babxba
***X*#*Y$*** = xabxa#babxba$

Leaves with labels in [0, 5]
are suffixes of ***X#***; labels of
[6, 12] are suffixes of ***Y$***
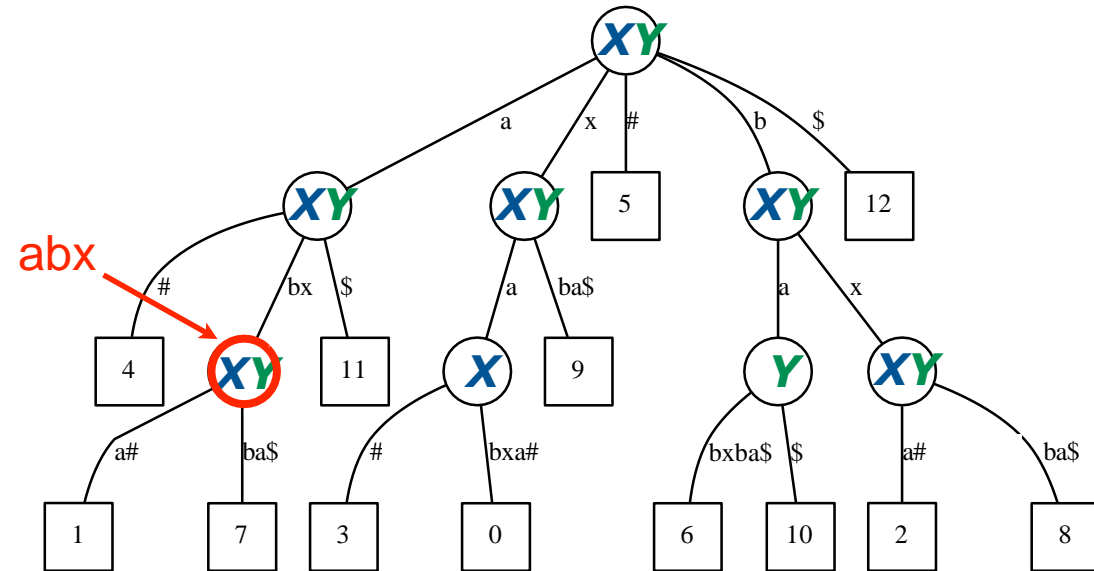

Traverse tree, annotating each node according to whether leaves below include suffixes of ***X***, ***Y*** or both

Node w/ greatest label depth annotated ***XY*** corresponds to LCS

$O(|X| + |Y|)$ time and space!

3 Other Applications

Generalized Suffix Tree

It's often useful to build a suffix tree of many strings at once

This is a *generalized suffix tree*. See *Gusfield* 6.4.

Suffix trees in the real world (MUMmer)

MUMmer v3.32 time and memory scaling when indexing increasingly larger fractions of human chromosome 1
For whole chromosome 1, took 2m:14s and used 3.94 GB memory

UNIVERSITAT POLITÈCNICA
DE CATALUNYA
BARCELONATECH

Suffix trees in the real world: the constant factor

$O(m)$ is desirable, but "constant factor" is significant, sometimes making the suffix tree inconvenient

Constant factor varies depending on implementation:

MUMmer constant factor = 3.94 GB / 250 million nt ≈ **15.76 bytes per nt**

Kurtz, Stefan. "Reducing the space requirement of suffix trees." *Software Practice and Experience* 29.13 (1999): 1149-1171.

Suffix tree of human genome will be >45GB, perhaps much larger depending on exact data structures underlying suffix tree nodes/edges
